What is an Information System?

Information systems play an important role in an organization. It is a combination of software, hardware and telecommunication networks to collect data needed in an organization. Information systems are methods and techniques used in order to store data, organize, manage and retrieve information digitally. Businesses and other organizations utilized the use of information systems in order to have smooth operation. Making it easy to interact with their customers and fast retrieval and processing of all the data needed in the business operation. To conclude, information systems are vital in today's operation for any organization (Jaiswal & Roy, 2022).
